

# Retention Campaign Operations Manual

## Campaign cadence

Retention campaigns run on a weekly contact cycle. A subscriber flagged for outreach in a given week is not re-contacted for the same underlying reason for at least 21 days, to avoid message fatigue. An exception applies to the tiered auto-renew reminder sequence (Playbook P1), which runs on its own fixed 7-day / 2-day schedule ahead of a known renewal date rather than the general 21-day cooldown.

## Channel selection

In-app notifications are the default channel for engagement-oriented playbooks (dormant win-back, low-engagement activation, recommendation quality), since these interventions rely on the subscriber opening the app to experience the fix. Email is the default channel for billing-oriented playbooks (auto-renew reminders, discount-expiry notices, plan-commitment offers), since these need to be actionable even if the subscriber has not opened the app recently.

## Offer governance

Any discount-bearing offer must be logged against the subscriber's account with an expiry date and a reason code tied to the playbook that generated it. A subscriber may not be on more than one active discount-bearing offer at a time; if a new playbook would generate a second concurrent offer, the higher-value offer wins and the other is suppressed rather than stacked.

## Escalation and hand-off between playbooks

Campaigns are expected to hand off between playbooks as a subscriber's signals change rather than running independently. The two required hand-offs are: (1) an auto-renew reminder sequence (P1) that reaches its final tier without a renewal hands off to dormant win-back (P4) rather than continuing to send renewal-framed messages to a now-lapsed account; (2) a negative activity\_trend nudge (P6) that does not arrest the decline within one contact cycle escalates to the full dormant win-back sequence (P4) rather than repeating the same lightweight nudge indefinitely.
